If you have any queries to add, or disagree with something I'm saying, feel free to comment & let me know. I'll try to get it right first time :) Comparative risk stratification of patients with acute coronary syndrome without ST elevation treated with primary PCI versus fibrinolytic therapy: A prospective multicenter study of the FRAPA registry. Primary percutaneous coronary intervention (P-PCI) and fibrinolysis (P-fibrinolysis) are alternative treatments for patients with acute coronary syndrome (ACS) without ST elevation. The aim of this study was to compare the risk for adverse events at 30 days of P-PCI and P-fibrinolysis in patients with ACS with myocardial infarction (MI) but without ST elevation and to identify predictors of adverse events. We compared patients with ACS with a diagnosis of MI but without ST elevation and undergoing P-PCI with those treated with P-fibrinolysis in the FRAPA (Evacuation and Recanalization of the Obstructed Coronary Artery) registry. Patients were divided into 2 groups: P-PCI (PCI without administration of thrombolytics) and P-fibrinolysis (administration of thrombolytics as the first therapy). The primary outcome was a composite of death, myocardial infarction, or stroke. After multivariate analysis of baseline clinical characteristics and multivessel coronary lesion revascularization, P-PCI and P-fibrinolysis were independently associated with the primary outcome (hazard ratio [HR]: 0.77; 95% confidence interval [CI]: 0.71-0.84; P
